

# Why a general ban on collaboration with industry is a bad idea

But a general check per project/program is not

# To meet climate goals we need:

- To reduce fossil consumption now (society and politics)
- Need new scalable technology (knowledge institutes and companies)
- Huge investments (companies and politics (thus society))
- Human capital with the proper training/background at all levels (education/companies)

# We do need new technology, not just just scale up

Scale up

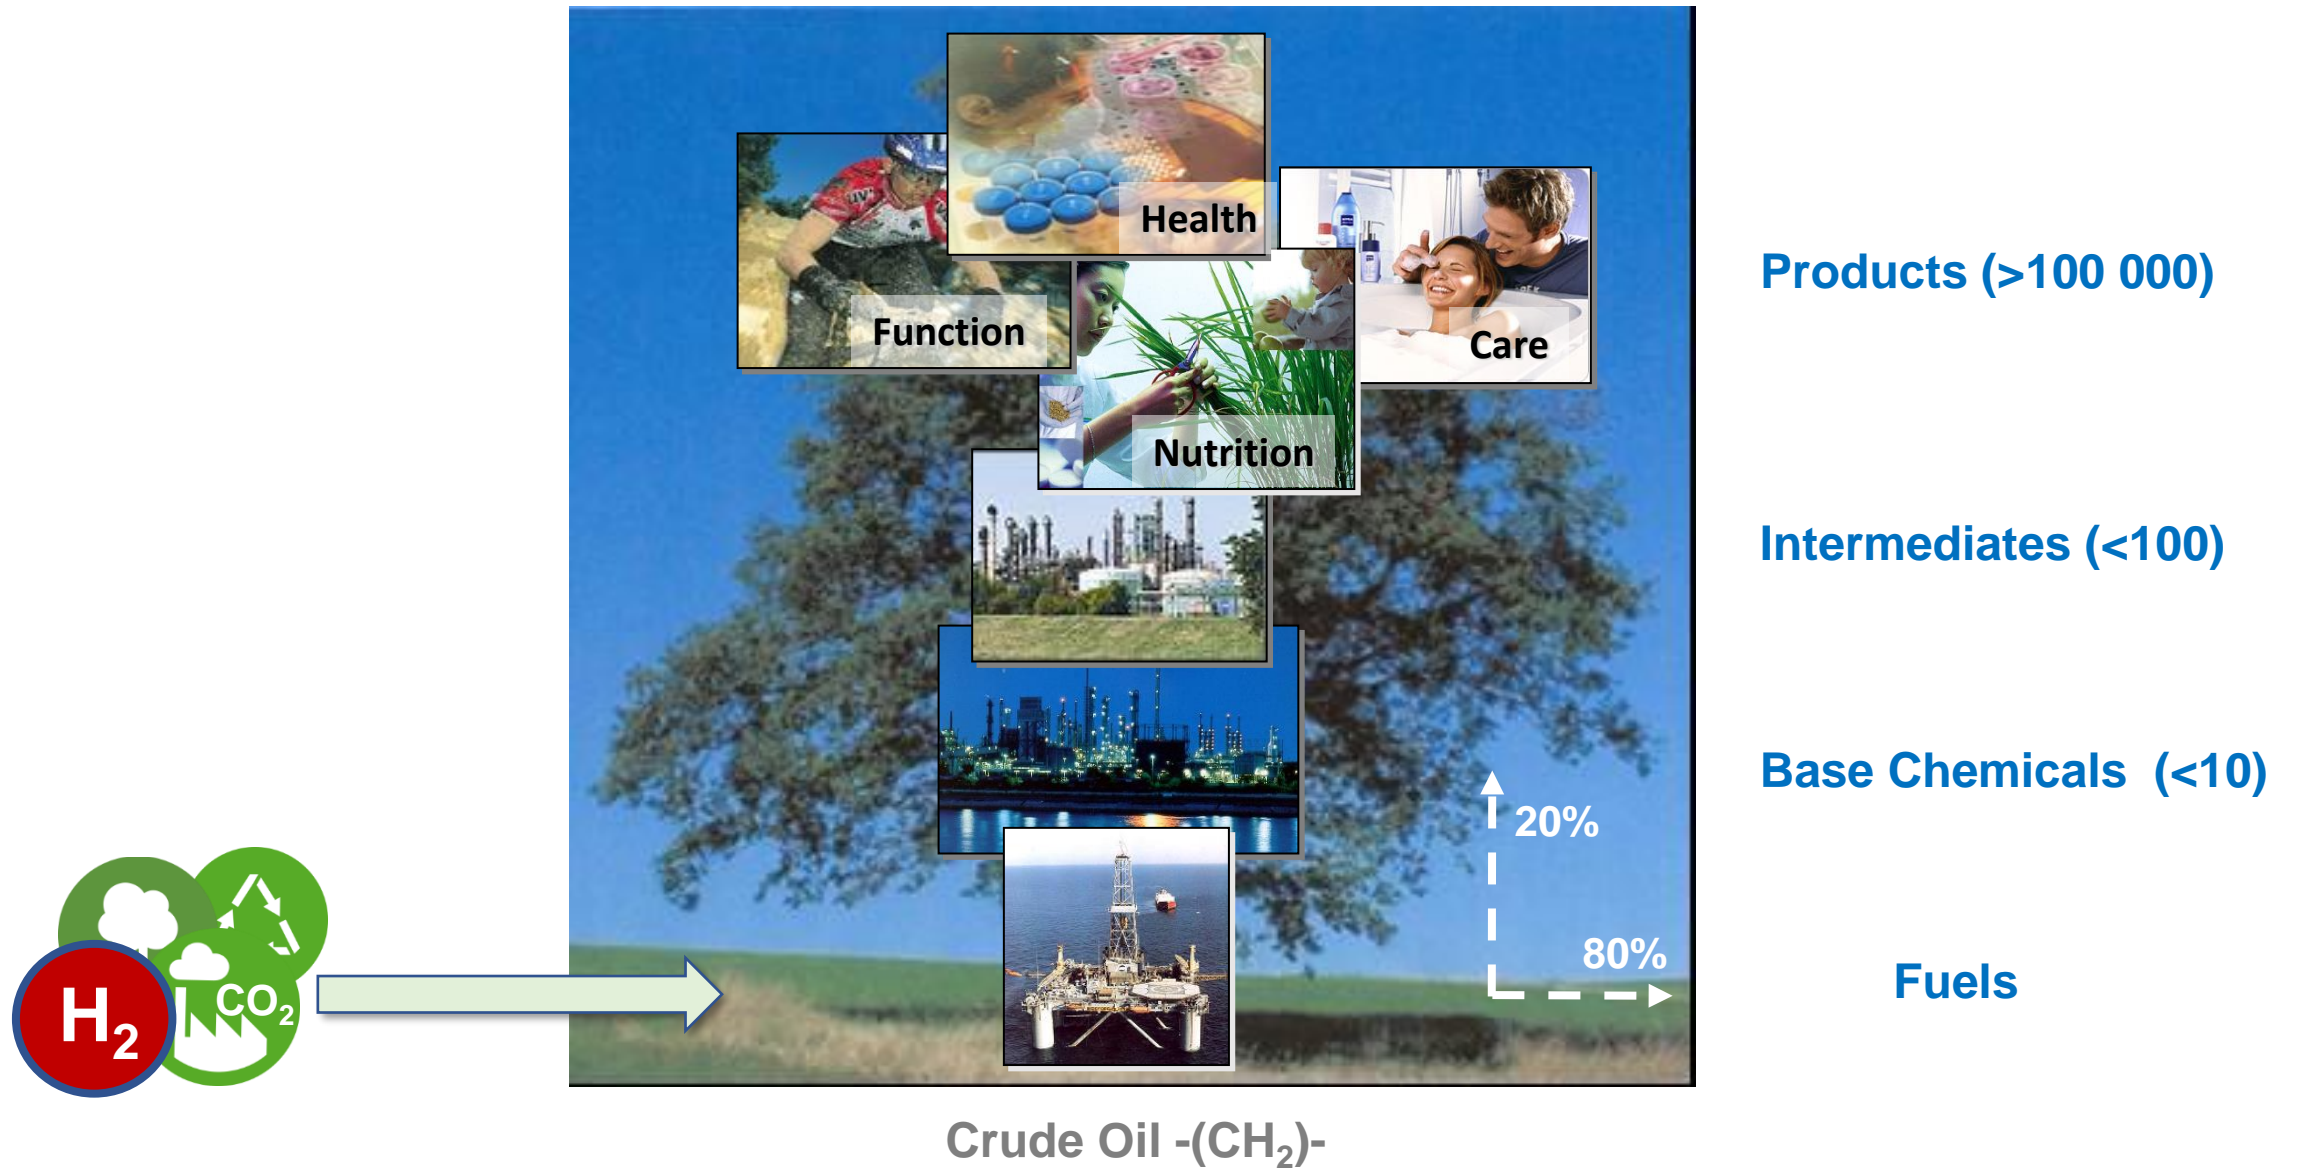

# We do need new technology, not just just scale up

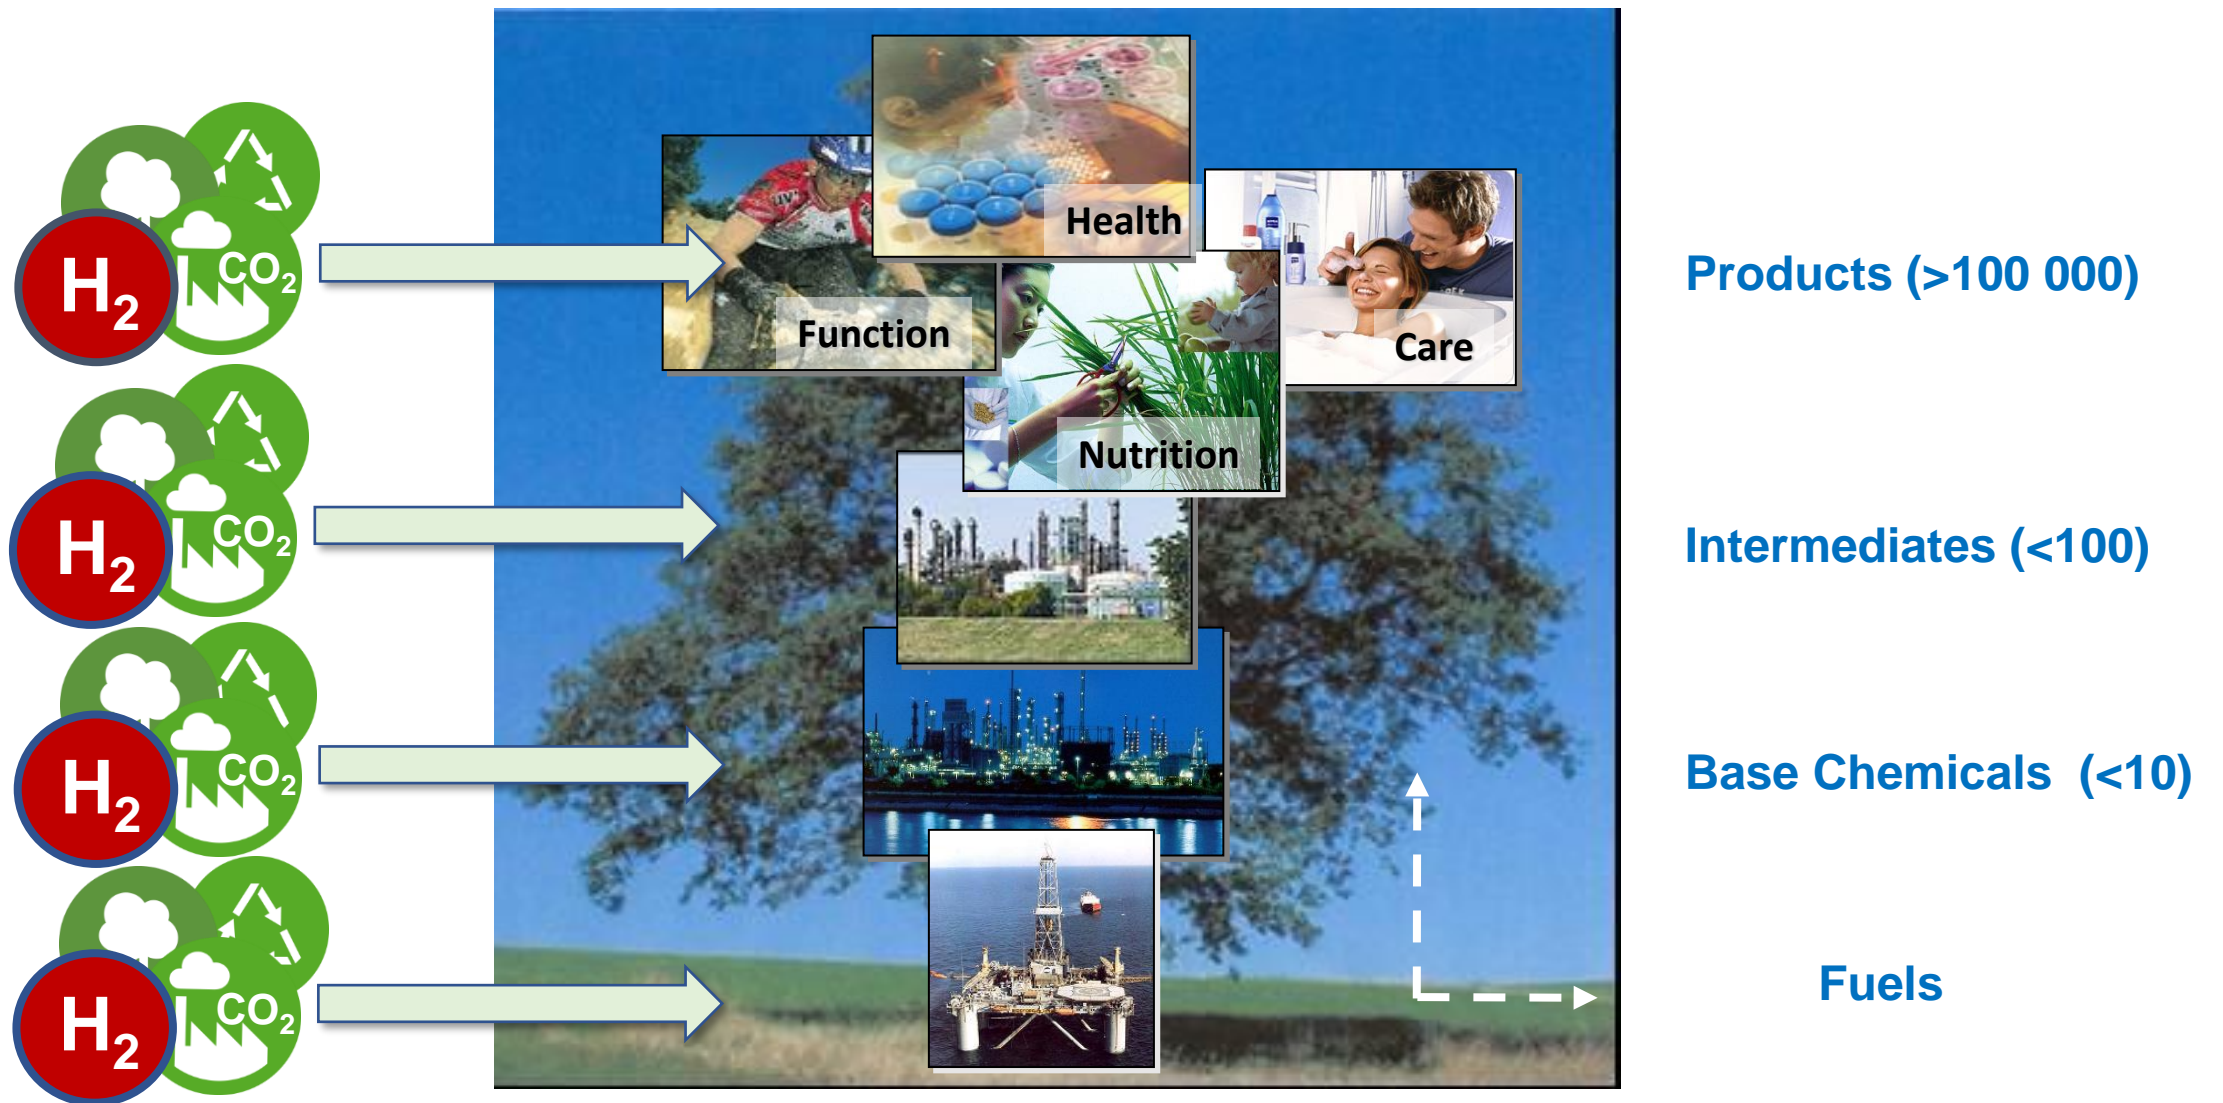

New technology

# THE OPPORTUNITY: DE-FOSSILIZATION OF THE „CHEMISTREE“

# THE OPPORTUNITY: DE-FOSSILIZATION OF THE „CHEMISTREE“

# A ban on collaboration with oil-companies:

- *To reduce fossil consumption now (society and politics)*

**Suggests that society doesn't play a role**

- *Need new scalable technology (knowledge institutes and companies)*

**Will substantially increase the time for technology development**

- *Huge investments (companies and politics (thus society))*

**Will reduce our influence on companies politics**

- *Human capital with the proper training/background (at all levels)*

**Will make technology studies/work less attractive for young people**

Lets intensify the discussions (and collaboration)  
with industry that need to (and will) change

The best way forward is to do this together
